DSL-IP · GLOBAL ENVIRONMENTAL BENEFITS AT A GLANCE

The global environmental benefits of restoring the drylands

Across **11 partner countries in three regions**, the Drylands Sustainable Landscapes Impact Programme commits to a coherent set of **Global Environmental Benefits** measured against the GEF-7 Core Indicators. Together the child projects target **more than 46 million tonnes of CO_2e mitigated** and over **13 million hectares of land restored or brought under improved management** — the environmental return that the proposed **DFSA** is designed to scale.

46.3M
TONNES CO_2E
Greenhouse-gas emissions mitigated over the projects' accounting periods.

13.1M ha
LAND RESTORED & IMPROVED
Degraded land restored plus landscapes under improved management practices.

1.19M ha
PROTECTED AREAS
Terrestrial protected areas created or under improved management for conservation.

834K
DIRECT BENEFICIARIES
People with improved livelihoods and land tenure — roughly 45% women.

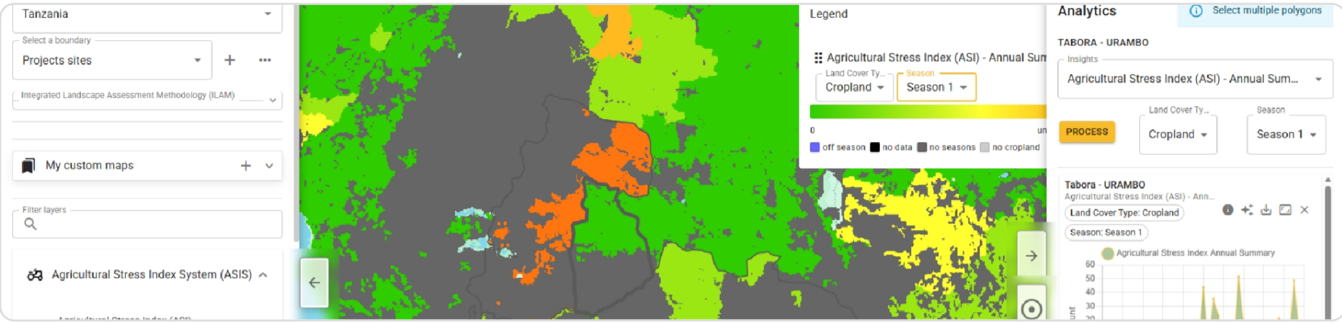
What "improved management" covers on the ground

Beyond protected areas, the programme's largest footprint is the working landscape — rangelands, dryland forests and farmland brought under sustainable land and forest management. In total it secures **around 14.2 million hectares**:

12.56M ha
Landscapes under improved practices

1.19M ha
Protected areas

0.49M ha
Land restored



The programme's shared monitoring system (Earth Map / ASIS) tracks land condition across every project site — turning satellite and field data into the comparable indicators behind these benefits.

BY COUNTRY · BY CORE INDICATOR

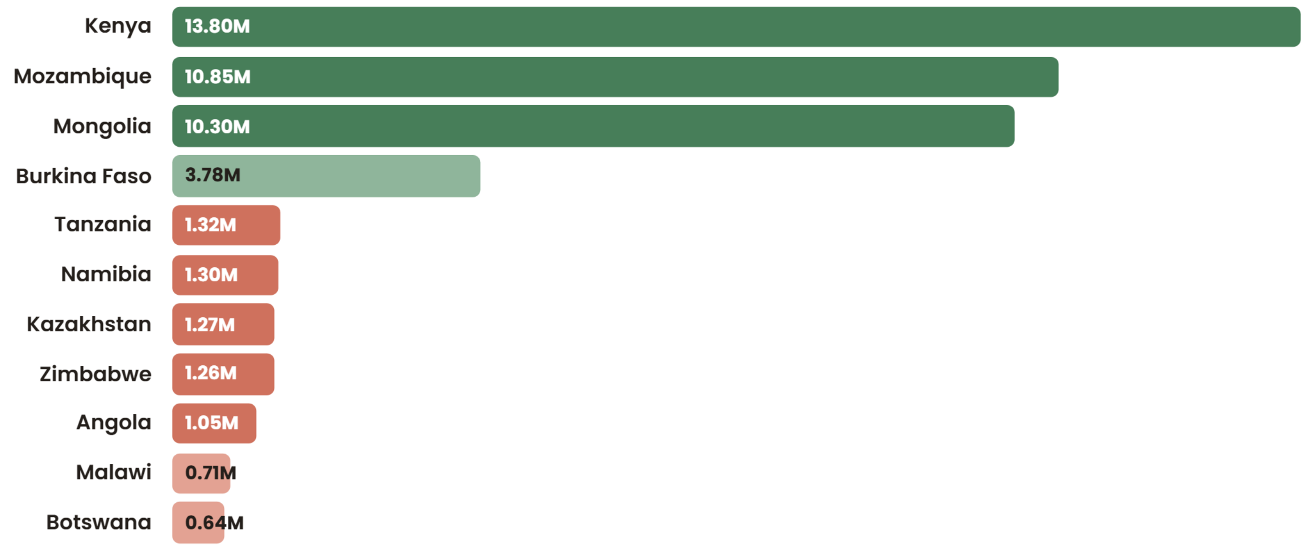
Where the benefits are delivered

CHILD PROJECT	LAND RESTORED (HA)	LANDSCAPES IMPROVED (HA)	GHG MITIGATED (TCO_2E)	DIRECT BENEFICIARIES
Angola	9,288	623,990	1,047,911	10,000
Botswana	20,000	545,000	637,745	17,900
Burkina Faso	150,000	730,000	3,776,377	300,000
Kazakhstan	4,000	816,000	1,271,505	30,000
Kenya	750	600,000	13,800,000	200,000
Malawi	16,299	420,539	712,288	150,000
Mongolia	248,827	5,640,317	10,302,215	25,241
Mozambique	6,700	1,017,383	10,845,249	16,000
Namibia	200	360,000	1,301,476	10,000
Tanzania	34,885	761,352	1,318,948	60,000
Zimbabwe	2,150	1,046,713	1,257,525	15,000
Programme total	**~493,000**	**~12.56M**	**~46.3M**	**~834,000**

Table 1. GEF-7 Core Indicator targets at project endorsement, from the project documents (CI 3 land restored, CI 4 landscapes under improved practices, CI 6 GHG mitigated, CI 11 direct beneficiaries). Mongolia additionally targets 1.19M ha of protected areas (CI 1). Figures are indicative targets, not yet verified results.

Carbon benefit is concentrated in a few large landscapes

Three projects — Kenya, Mozambique and Mongolia — account for roughly **three-quarters of the programme's mitigation target**, reflecting very large forest and rangeland landscapes. Smaller projects still deliver substantial restoration and livelihood benefits.



GHG mitigated by child project (million tonnes CO_2e, endorsement targets). Bar length is proportional to the largest project.

THE CATALYTIC ENGINE

How the Global Coordination Project makes the benefits add up

Eleven national projects would otherwise report in eleven different ways. The **Global Coordination Project (GCP)** is the programme's catalytic layer: it harmonizes how benefits are defined, measured and compared, turning isolated project results into a single, aggregatable body of evidence — and feeds that learning back so every project performs better.

11 COUNTRY PROJECTS

- National landscapes & targets
- Local data & field monitoring
- Diverse agencies: FAO, World Bank, IUCN, WWF
- Different baselines & methods

›

GLOBAL COORDINATION PROJECT

- **Common results framework** — GEF-7 Core Indicators + LDN, applied identically
- **DRIP** monitoring & reporting platform across all sites
- **Shared methods** — ILAM assessment & SLPF land-potential tools
- **Three Communities of Practice** moving knowledge between countries

BENEFITING

Evidence to scale
BANKABLE, PROVEN MODELS

The GCP converts eleven separate projects into one comparable, aggregatable programme — the precondition for reporting global environmental benefits at scale.

Why this is catalytic, not just administrative

HARMONIZE	AGGREGATE	SCALE
ONE LANGUAGE FOR BENEFITS	**THE WHOLE EXCEEDS THE PARTS**	**LEARNING COMPOUNDS**
Identical indicators, baselines and methods mean a hectare restored in Angola counts like one in Mongolia — results can be summed and compared.	Pooled monitoring (DRIP) lets the programme report 46M tCO_2e and 13M ha as one figure to the GEF, donors and conventions.	Communities of Practice spread what works, de-risking the next investment and raising the return on every dollar.

THIS IS THE BACKBONE OF THE PROPOSED DFSA

The DFSA does not start from zero. The GCP has already built the **measurement, methods and knowledge infrastructure** that lets dryland investment demonstrate real, aggregated global environmental benefits — 46M tCO_2e, 13M ha, 834K people. The DFSA's role is to **build on this proven impact and focus on scaling**: channelling new and blended finance into the same harmonized, evidence-based system so every additional investment in drylands compounds results already being measured and improved.
